

LogiPointer

light pointer for the identification of picking location in the LogiMat tray...

LogiPointer makes it even easier to locate the right items in the LogiMat trays. LogiPointer cooperates with our picking software SHARK and receives the information, from which location the goods are to be picked. At the same time a cone of light points at the picking location of the tray.

Perfect for a 100% "pick to light" solution. There are various options of shapes and colours of the cone of light in LogiPointer, and LogiPointer can of course be combined freely with our other options.

LogiPointer can be delivered as an option on new LogiMat vertical lifts, and it can be mounted on existing units...

Please note! LogiPointer must be controlled by our software application SHARK pointer, or a similar system.
